TECHNICALSCIENCES

Issue №2
Vol.2
November 2017

Published by:
Sergeieva Iuliia

This volume contains research papers of scientists in the field of Technical sciences.

Editor: PhD Kupriyenko Sergiy

Editorial board:

Averchenkov Vladimir, Doctor of Technical Sciences, Professor, Russian

Antonov Valery, Doctor of Technical Sciences, Professor, Academician, Ukraine

Bykov Yuri, Doctor of Technical Sciences, Professor, Russian

Goncharuk Sergey, Doctor of Technical Sciences, Professor, Academician, Russian vb

Zakharov Oleg, Doctor of Technical Sciences, Professor, Russia

Capitanov Vasily, Doctor of Technical Sciences, Professor, Ukraine

Kalaida Vladimir, Doctor of Technical Sciences, Professor, Academician, Russian

Information for Authors

The International Scientific Periodical Journal "*Modern Technology and Innovative Technologies*" has been published since 2017 and has gained considerable recognition among domestic and foreign researchers and scholars.

Periodicity of publication: Quarterly

The journal activity is driven by the following objectives:

- Broadcasting young researchers and scholars outcomes to wide scientific audience
- Fostering knowledge exchange in scientific community
- Promotion of the unification in scientific approach
- Creation of basis for innovation and new scientific approaches as well as discoveries in unknown domains

The journal purposefully acquaints the reader with the original research of authors in various fields of science, the best examples of scientific journalism.

Publications of the journal are intended for a wide readership - all those who love science. The materials published in the journal reflect current problems and affect the interests of the entire public.

Requirements for articles:

Articles should correspond to the thematic profile of the journal, meet international standards of scientific publications and be formalized in accordance with established rules. They should also be a presentation of the results of the original author's scientific research, be inscribed in the context of domestic and foreign research on this topic, reflect the author's ability to freely navigate in the existing bibliographic context on the problems involved and adequately apply the generally accepted methodology of setting and solving scientific problems.

All texts should be written in literary language, edited and conform to the scientific style of speech. Incorrect selection and unreliability of the facts, quotations, statistical and sociological data, names of own, geographical names and other information cited by the authors can cause the rejection of the submitted material (including at the registration stage).

All tables and figures in the article should be numbered, have headings and links in the text. If the data is borrowed from another source, a bibliographic reference should be given to it in the form of a note.

The title of the article, the full names of authors, educational institutions (except the main text language) should be presented in English.

Articles should be accompanied by an annotation and key words in the language of the main text and must be in English. The abstract should be made in the form of a short text that reveals the purpose and objectives of the work, its structure and main findings. The abstract is an independent analytical text and should give an adequate idea of the research conducted without the need to refer to the article. Abstract in English (Abstract) should be written in a competent academic language.

The presence of UDC, BBK

Acceptance of the material for consideration is not a guarantee of its publication. Registered articles are reviewed by the editorial staff and, when formally and in substance, the requirements of the journal are sent to peer review, including through an open discussion using the web resource www.sworld.education

Only previously unpublished materials can be posted in the journal.

Regulations on the ethics of publication of scientific data and its violations

The editors of the journal are aware of the fact that in the academic community there are quite widespread cases of violation of the ethics of the publication of scientific research. As the most notable and egregious, one can single out plagiarism, the posting of previously published materials, the misappropriation of the results of foreign scientific research, and falsification of data. We oppose such practices.

The editors are convinced that violations of copyrights and moral norms are not only ethically unacceptable, but also serve as a barrier to the development of scientific knowledge. Therefore, we believe that the fight against these phenomena should become the goal and the result of joint efforts of our authors, editors, reviewers, readers and the entire academic community. We encourage all stakeholders to cooperate and participate in the exchange of information in order to combat the violation of the ethics of publication of scientific research.

For its part, the editors are ready to make every effort to identify and suppress such unacceptable practices. We promise to take appropriate measures, as well as pay close attention to any information provided to us, which will indicate unethical behavior of one or another author.

Detection of ethical violations entails refusal to publish. If it is revealed that the article contains outright slander, violates the law or copyright rules, the editorial board considers itself obliged to remove it from the web resource and from the citation bases. Such extreme measures can be applied only with maximum openness and publicity.

Sections of the Journal:

Library of Congress Classification Outline	Sections
Subclass TJ / TJI-1570	Mechanical engineering and machinery

Abstract. *Eccentric compression in agricultural buildings reinforced concrete elements gable frame reasons describes in the article. Pole and girder fixed joint execution leads to internal forces reduction in specified elements. This, in turn, cross-sections and structure total material content reduces. On other hand, fixed joint arrangement complicates its design and bearing capacity calculation. The authors propose to calculate strength in standard section of eccentric compressed reinforced concrete rectangular cross section L shaped half frame on basis of stress-strain model and extreme strength criterion using concrete nonlinear diagram and reinforcement two-line state diagram.*

Key words: *reinforced concrete element, fixed joint, eccentric compression, standard section, stress-strain behavior, stress-strain model.*

Introduction.

To date, for buildings construction is widely used reinforced concrete structures. Construction lead high rates to decrease their material content, labor intensity and cost at design stages, installation and maintenance while increasing buildings safety. Buildings and structures frameworks reducing cost can be achieved at expense by improving the structures themselves (reducing their mass by light concrete and high-strength reinforcing steel using, etc.) or by changing building bearing construction design scheme [1, 2].

Review the status of the issue.

Special frame type industrial buildings which are equipped with systems of mechanization are required for agriculture. In Ukraine agricultural construction,

houses with no intermediate supports 12, 18 and 21 m (wide) and using three hinge reinforced concrete frames became popular [3] (see fig. 1).

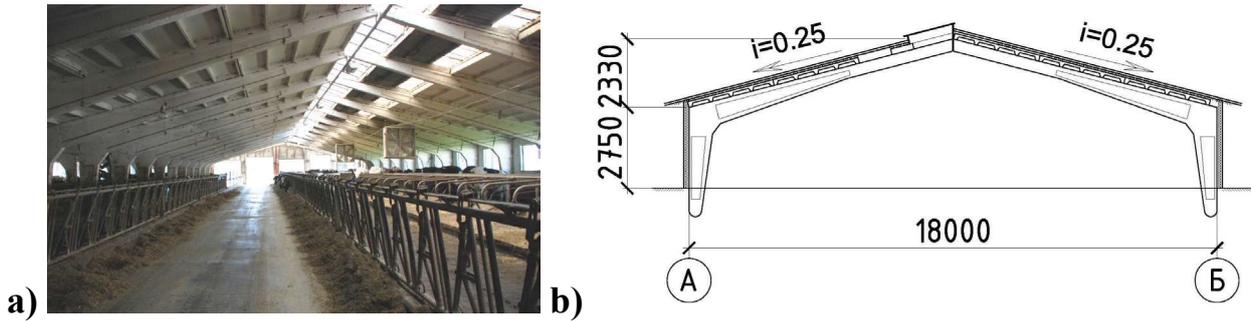

Figure.1. Three hinge (gable) reinforced concrete frames buildings: a) general view; b) overall dimensions

Therefore, rational solutions and methods calculating frame structures from three hinge reinforced concrete frames agricultural industrial buildings construction, rural public buildings hallways and agricultural aviation airfields structures development tasks are relevant.

The main text.

Three hinge reinforced concrete L-shaped half frames allow to reduce internal forces in cross-section rafter span due to pole and girder fixed joint arrangement and hinge in middle of span between half frames inserting. However, due to such solution, there is pole bending moment, which is equal to girder bending support moment. Thus, the frame stanchion works on eccentric compression. On the figure 2 shows the internal forces distribution in the buildings frame elements are considered which.

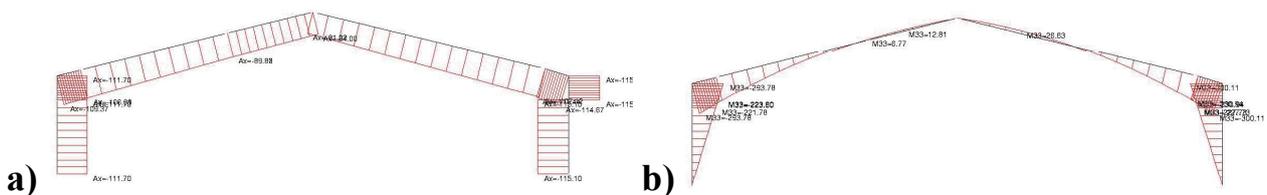

Figure.2. Diagrams of internal forces in frame’s elements: a) axial force diagram; b) bending moment diagram

The authors propose to calculate strength in standard section of eccentric compressed reinforced concrete rectangular cross section pole on basis of stress-strain model and extreme strength criterion using concrete nonlinear diagram and reinforcement two-line state diagram [4]. The proposed calculation method during experimental studies and computer finite element modeling of a samples series [5] is tested by the authors, shown on the figure 3.

Summary and Conclusions.

Eccentric compressed reinforced concrete elements experimental and numerical investigations confirm theoretical calculations accuracy which based on the stress-strain model and the extreme strength criterion.

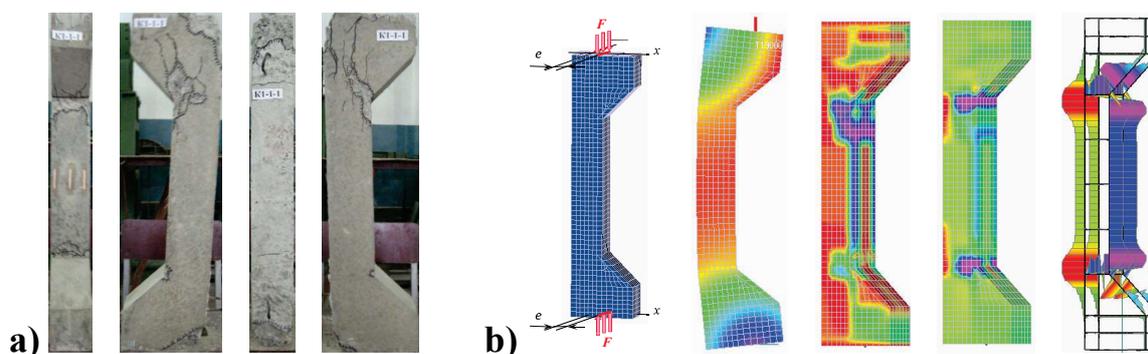

Figure.3. Eccentric compressed reinforced concrete elements experimental samples: a) experimentally tested; b) numerical models

Аннотация. *Выполнение жесткого узла стойки и ригеля Г-образных полурам сельскохозяйственных зданий приводит к уменьшению внутренних усилий в указанных элементах. Это в свою очередь позволяет уменьшить их сечения и общую материалоемкость конструкции. С другой стороны, устройство жесткого узла усложняет его конструкцию и расчет несущей способности, так как элементы Г-образных полурам работают на сложный вид сопротивления, а именно внецентренное сжатие. Авторами статьи предлагается проводить расчет прочности в нормальном сечении внецентренно*

сжатых железобетонных элементов прямоугольного сечения на основе деформационной модели и экстремального критерия прочности с использованием нелинейной диаграммы бетона и двухлинейные диаграммы состояния арматуры.

Ключевые слова: *железобетонный элемент, жесткий узел, внецентренное сжатие, нормальное сечение, напряженно-деформированное состояние, деформационная модель.*
