THE MAIN TRENDS IN SUSTAINABLE DEVELOPMENT IN EUROPE

Among the world's regions, Europe has the most experience in developing and implementing sustainable development strategies. While the initial sustainable development strategies of EU countries primarily focused on environmental protection issues, now all three components of sustainable development (economic, social, and environmental) are more or less evenly addressed. Two types of sustainable development strategies: covering three key areas of sustainable development: economic, social and environmental; cover the three key areas of sustainable development and touch upon aspects of international cooperation.

Innovative approaches to implementing standards

Strengthening partnership with business	Knowledge and technology transfer	Financing innovative projects	Use of modern technologies
The recommendations of European standards can help create mechanisms for cooperation between government agencies and the private sector. This opens the way to innovative programs and projects aimed at improving the quality of life of Ukrainians.	Implementation of European standards in the field of sustainable development involves the exchange of knowledge and best practices. This can be done through training programs, internships, and partnerships with European companies.	Development of approaches to attracting financing for the creation and implementation of innovative projects based on European standards of sustainable development in Ukraine. This will be reflected in the development of effective and promising solutions in the social sphere.	Integration of the latest technologies into the field of sustainable development is a key element in improving infrastructure, energy efficiency and environmental safety. The use of digital solutions will facilitate faster implementation of European standards.

Fig.1 Innovative approaches to implementing standards

The perspectives for sustainable development of Ukraine's social sector lie in the introduction of innovative approaches that will improve the provision of social services. An important step is to implement quality standards that will guarantee a high level of these services for citizens. The public should also be actively involved in the management of the social sector to ensure a more efficient and transparent system.

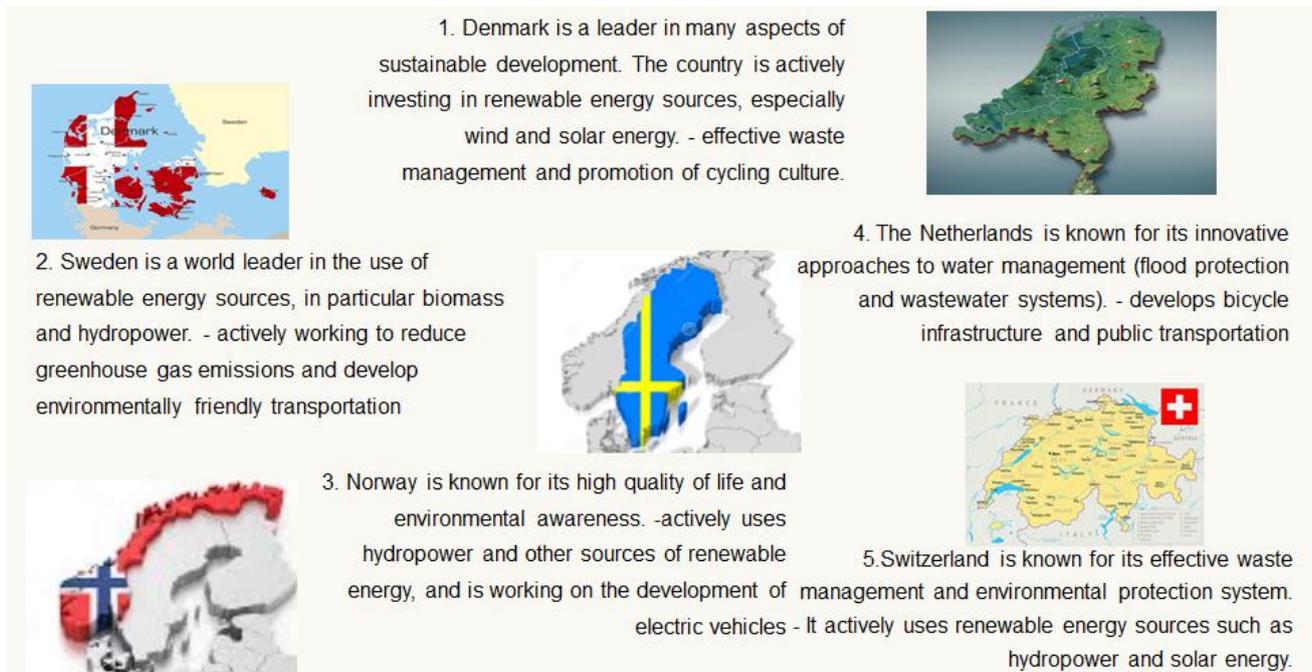

Fig.2 Main trends in sustainable development in Europe

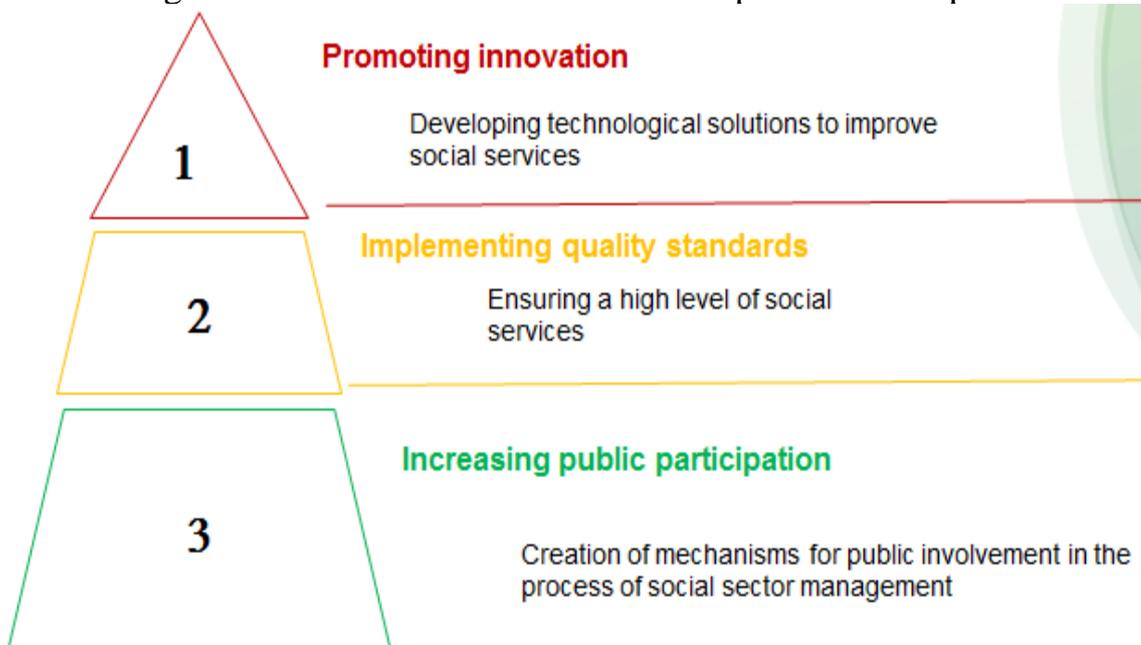

Fig.3 Perspectives and recommendations for Ukraine

In the context of Ukraine's integration into the European space, there is a need to revise the fundamental principles of the policy of increasing the socio-economic potential of sustainable development [1] of the country as a whole and its regions in order to accelerate the documentary and actual implementation of the European Union directives relating to certain areas of life and requiring the use of new methods and forms of expanded reproduction of national wealth. The socio-economic, technical, technological and production-economic state of the national economic system in the current economic environment with resource constraints and increasing external and internal socio-political threats to sustainable development actualizes the task of updating the theoretical and methodological foundations of sustainable development potential formation. Given the diversity of the latter's component

composition, the necessity of using the methods of geometric econometrics and fractal graphs to break the most irrational relationships between individual potentials is proved.
